Not illustrated. 1921 Excerpt: . . . the secondaries Y connected; this is also called the unsymmetrical Y connection, because this arrangement does not give a balanced three-phase system on the secondary. An important problem which arises in connecting the three phases of the alternator is the question of harmonics, if the machine is wound in the J arrangement or if the phases are connected in Y. The capacities of each transformer for I and Y connections, must be equal to one third of the total load in kilovolt amperes. This for any power factor is $E_{V1} E_{I1} = E_{V3} E_{I3}$. The three required transformers V_3 have then a total capacity of $3 E_{V1} E_{I1}$. If the windings are A connected, they will produce full line voltage and carry a current I , but when Y connected, they will produce a voltage V_3 . V_3 is $\sqrt{3}$ times the line voltage and carries full line current. In T connection, the coils...
